PROFESSIONAL INTRODUCTION

Hello,

I'm a principal engineer and AI architect. I work across full-stack applications and cloud infrastructure, with a current focus on LLM applications, custom agent workflows, and voice AI. I stay involved from understanding the problem through implementation and delivery.

At Atoms, I'm Principal Engineer for James Clear's Atomic Habits app. As Founding Engineer and CTO at Spoon, I'm building a restaurant platform that connects financial, point-of-sale, and inventory data. I also founded OneNeural for applied AI consulting and product development, and lead technology at Ayrin Digital as CTO.

Much of my work involves connecting new software to systems people already depend on. I work with product teams and domain experts to understand the workflow, decide what to build first, and carry those decisions through the application, APIs, data, and deployment.

My AI work includes hiring workflows with voice interviews, retrieval over private knowledge, and a real-time support co-pilot experiment. The useful questions are specific: what information does the model need, which actions can it take, and how will someone know whether the result is right?

Earlier, at Symbl.ai, I worked on real-time conversation intelligence and its processing latency and reliability. Client delivery at Mutual Mobile and work in mobile, cloud, and connected devices shaped how I approach engineering. I value clear technical decisions, software a team can maintain, and staying close enough to the code to understand where the difficulties are.

Best regards,

Subodh Jena
